

It is without a doubt that the world, not only America, has technologically advanced over the decades of life that have passed. The world has become much more digitized and more cybernetic than ever before. With that comes another form of vulnerability by having to display information that is personal to the internet with no ideal certainty that it is fully protected. Cyber security attacks have become stronger and better than ever when it comes to this due to people living their lives on the internet. Covid-19 has made this issue much more prominent due to the fact people have had to live lives much more virtually using the internet and living online. This causes Cyber attacks to be much higher because the amount of online usage has gone up and higher as covid nine teens have been getting more and more of a safety issue and hazard. Cyber attacks have been known to create much bigger issues in national security and have much more dire repercussions at that. With the people being on social media a lot more due to the virus there's much more opportunities for cyber attacks to happen especially with these fake accounts and pages on the internet and on these social media sites such as Instagram Facebook ,Snapchat and etc there is a lot of thing can affect the national security of the countries with cyber attacks which can also lead to many countries having the same follow up with this. The pandemic has changed the way we have lived our lives and at the same time made us much more reliant on the internet to give us what we had prior to the quarantine. With things such as classes and education being online it has allowed us to become much more present in the education department but we also lose the social interaction that we had on the day to day basis which makes it much harder to maintain the life of virtual learning and living there are many pros but also many cons at the same time. Cybersecurity is very important in today's time especially during the covid nine teen pandemic because we need to keep our information much safer when the online usage had gone up substantially in the past two years. I am very interested in seeing where the future of cyber attacks and cyber security as a whole would end up being or how far it will go.
